Life Ontology

A household inventory and deals agent

Built with:

Next.js · Prisma · SQLite · AI SDK · Tavily

The problem

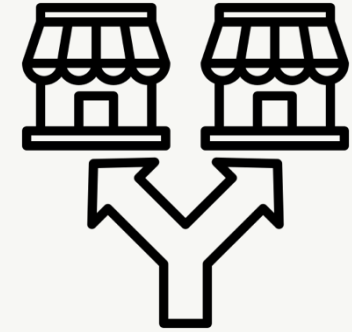

Running out

Home supplies hit zero before anyone notices a restock is due.

Unknown prices

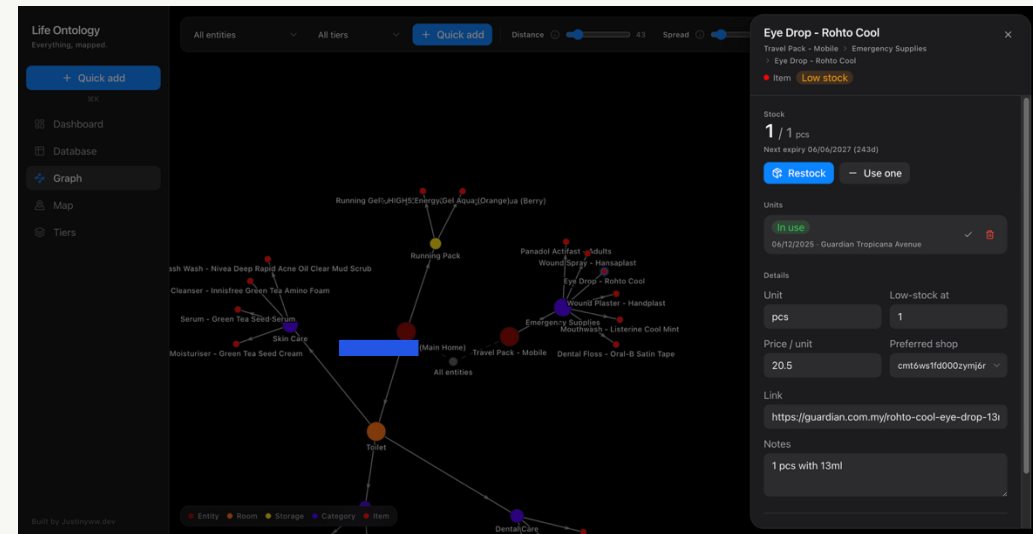

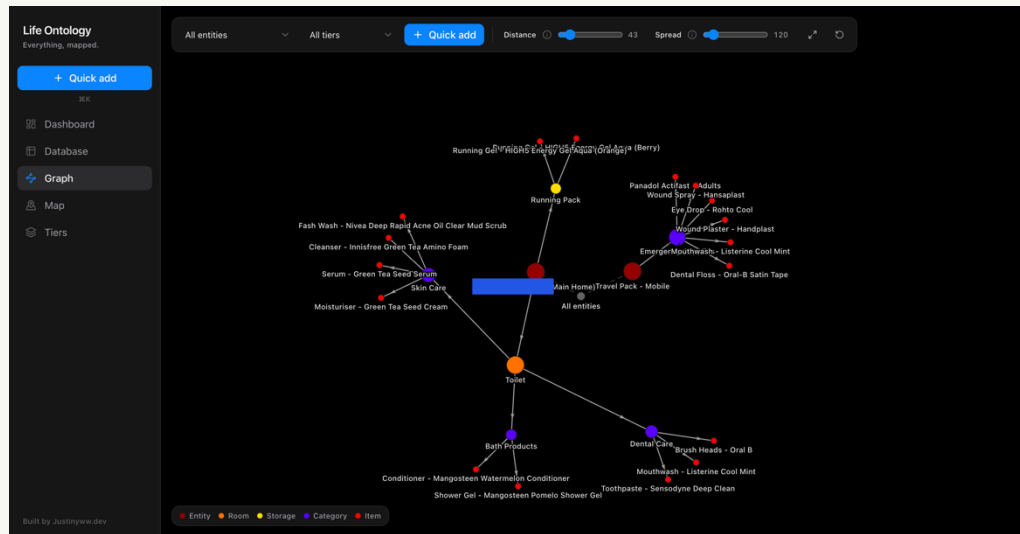

What was actually paid, set against the retail price, goes unrecorded.

Too many shops

Comparing retailers by hand is slow, so prices go unchecked.

The core idea

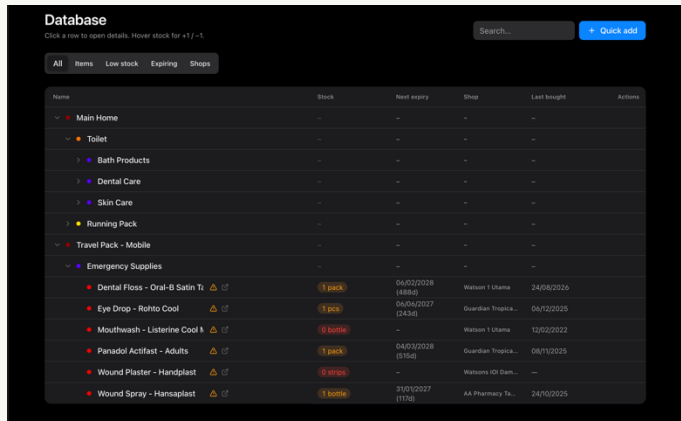

Every physical unit is its own record.

Home › Room › Shelf › Category › Item › **Unit**

Price, shop, usage and expiry are logged on each unit. Stock, last bought dates and restock forecasts are calculated from those records, not typed in.

Tree

An editable hierarchy of homes, rooms, shelves, categories and items.

Graph

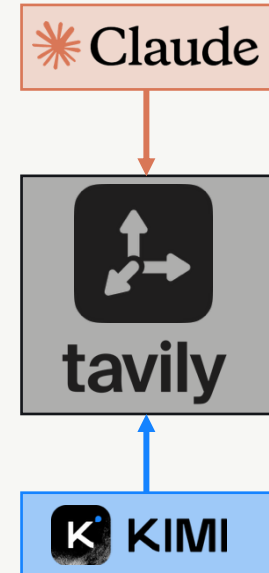

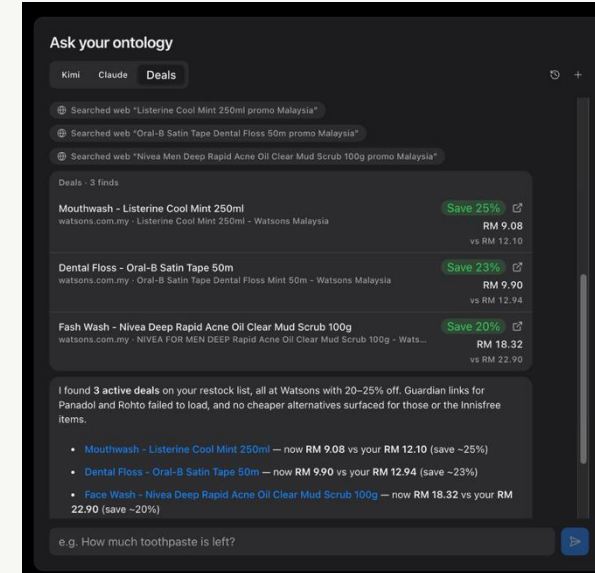

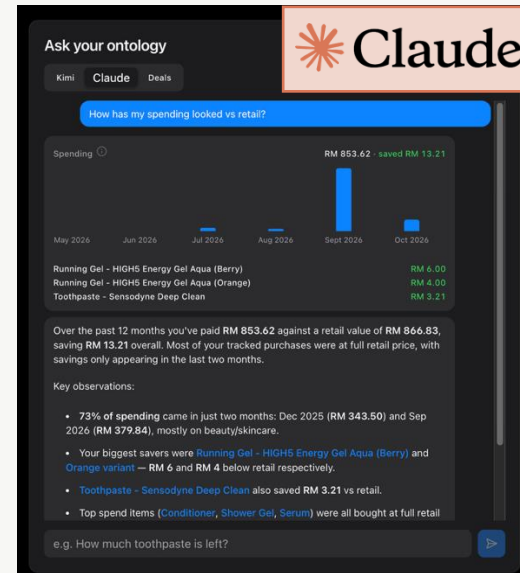

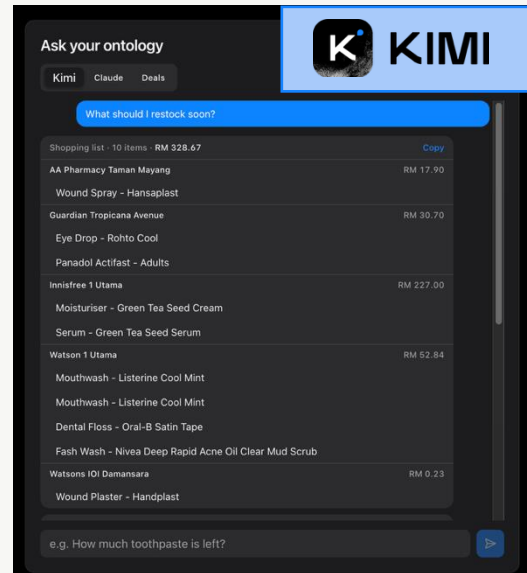

A force-directed graph that shows how everything nests.

Map

The homes, and the shops each item is bought from.

The agent

Ask

A chat panel answers questions about stock, spending and shopping lists by preferred shop, using tool calls over your own records. A lighter model handles everyday lookups and Claude handles longer analysis.

Deals

A separate mode checks saved product links and searches Malaysian retailers. It surfaces only prices below what the household usually pays.
